

The following table shows the results of the regression analysis for the dependent variable "Number of children in the household" (N = 1,000). The independent variables are "Age of the head of household" and "Gender of the head of household". The results are presented in two columns: "Coefficient" and "Standard Error". The "t-statistic" is also provided for each variable. The "F-statistic" for the overall model is 1.23, and the "R-squared" value is 0.01.

Variable	Coefficient	Standard Error	t-statistic
Age of the head of household	0.001	0.001	0.5
Gender of the head of household	0.002	0.002	0.5

The results indicate that the age and gender of the head of household have a very small, positive effect on the number of children in the household. The overall model is not statistically significant.
